

Induction Protocols: Updated February 2022 Directed By: Dr. Kyle A. Yarde, DVM

Cattle:

- Dexamethasone (2mg/ml) 10ml, IM
- Lutalyse (5mg/ml)- 5ml, IM or Lutalyase HighCon (12.5 mg/ml)- 2ml, IM
 - Give injections (at the same time) in the back of the thigh muscles
 - Use an 18g x 1.5" needle to ensure good muscle absorption
 - Expect Labor in the next 24-36hrs

Swine:

- Estrumate (250mcg/ml)- 1ml, IM
- Oxytocin (2mg/ml)- 1/2ml, IM
 - Give the Estrumate FIRST. Then 20 hours later, give the Oxytocin
 - Give both injections in a highly muscled area (neck or ham)
 - Use an 18g x 1.5" needle to ensure good muscle absorption
 - Expect Labor in the next 4hrs

Goat:

- Estrumate (250mcg/ml)- 1/2ml, IM
 - Give Estrumate in the muscles of the neck
 - Use an 18g x 1.5" needle to ensure good muscle absorption
 - Goats pregnancy is dependent on the CL, no dexamethasone is needed
 - Expect Labor in the next 30-35hrs

Sheep:

- Estrumate (250mcg/ml)- 1/2ml, IM
- Dexamethasone (2mg/ml)- 8ml, IM
 - Give injections (at the same time) in the muscles of the neck
 - Use an 18g x1.5" needle to ensure good muscle absorption
 - Expect Labor in the next 24-72hrs
